AUTHOR:

Witkowski, Józef, Professor, Doctor

TITLE:

Latitude Station of the Polish Academy of Sciences at
Borowiec

PERIODICAL:

Acta geophysica polonica, 1959, Nr 1, pp 3-8 (Poland)

ABSTRACT:

The author describes the situation, the technical equipment and the activities of the newly built station. The geographical coordinates of the Latitude Station at Borowiec are $1^{\text{h}} 48' 18.845''$, $+ 52^{\circ} 16' 38''$, and the elevation is 80 m above sea level. The station lies on the same parallel of latitude as the Station of Irkutsk. The station consists of the office building, a dwelling house, a farm building, two observing houses for zenith-telescopes and two others for transit-instruments, a 10 m deep underground room for clocks and horizontal pendulums. The observing houses are equipped with one Zeiss zenith-telescope of aperture 135 mm and focal length 1750 mm, and with one zenith-telescope built in the workshops of the Poznań University Observatory, aperture 110 mm and the focal length 2020 mm. In the other two observing houses

Card 1/3

POL/26-59-1-1/20

Latitude Station of the Polish Academy of Sciences at Borowiec

are two modern Zeiss transit-instruments of 100 mm aperture and 1000 mm focal distance. The time service of the station is equipped with three crystal clocks and one pendulum clock of the Shortt type delivered by the Synchronome Co Ltd, London. The crystal clocks were designed by the consulting electrical engineer of the Station Mr. S. Cierniewski. The two horizontal pendulums are double pendulums of the Lettau type and were also designed in the workshops of the Poznan Observatory. The gravity variations are registered with an Askania GS-11 gravity meter. The station takes part in the activities of IGY as concerns latitude, longitude and earth tides. The latitude observations began in August 1957, the time service and longitude observations were started in October 1957, the observations of earth tides began at the end of September 1958. The number of Talcott star-pairs observed by the station was 1860 up to October 1958. 2590 star transits have been recorded with the two Zeiss instruments. The staff of the station also takes part in observations of "sputniks". ✓

Card 2/3

Latitude Station of the Polish Academy of Sciences at Borowiec POL/26-59-1-1/20

The scientific staff of the station at present consist of: Director: Professor Doctor J. Witkowski; Head of the time service: Docent, Doctor F. Koecke, Associates: Doctor S. Andruszewski, Master of Sciences J. Dobrzycki (Latitude), Doctor H. Hurnik. Assistants: Master of Sciences M. Dobrzycka (Latitude, gravity meter), J. Domiński (Time service), J. Moczko (Time service), S. Nowak (Latitude, pendulums). The decision of building this latitude station was taken at the Latitude Conference held in Moscow in November 1949 (proposal of Professor A. V. Orlov, Head of the Latitude Service of the USSR). There are 18 photographs, 3 graphs and 1 diagram.

AUTHOR: Witkowski, Józef

TITLE: Earth crust tidal motions and their investigations at the PAS astronomical latitudinal station in Borowiec near Poznań

PERIODICAL: Nauka Polska, no. 3, 1960, 33-43

TEXT: In this article the author outlines the scope of investigations carried out at the Astronomiczna Stacja Szerokościowa Polskiej Akademii Nauk (Polish Academy of Sciences, Astronomical Latitudinal Station) in Borowiec organized in 1957. Coordinates of this station are: 52°16'38"N-10°08'18.4"E [Abstracter's note: There is an obvious mistake in the longitude coordinate. It should read 17°08'18.4"]. It is one of 33 stations of this type in existence and recorded in an official index issued by the Międzynarodowa Asocjacja Geodezji (International Geodesy Association) as a gravimetric and pendulum station. (There is also another astronomical observation station in Józefosław near Warsaw, a branch of the Polytechnic Institute in Józefosław, a branch of the Polytechnic Institute in Józefosław)

Card 1/4

P/002/60/000/003/001/003

D001/D101

Earth crust tidal motions ...

Warsaw, but it is not mentioned in the official register). In the introductory part of this article, the author discusses problems connected with earth-rotation and the phenomenon of earth crust tidal motions. The latter, a new branch of geophysics, was developed in western countries in the second part of the XIX century; in Poland investigations in this field commenced only very recently. Best known and observed symptoms of earth crust tidal motions are: (1) deviation of the plummet line in relation to the earth's crust; (2) deviation of the plummet line in relation to the world axis [Abstracter's note: An obvious misprint; it should read "earth's axis"]; (3) gravitation forces intensity fluctuations; (4) the decrease of the oceans' tidal amplitude. Less precisely elucidated are the earth crust elastic tension forces and the tides in underground water reservoirs. Further, the author points out the importance of an accurate knowledge of gravitation forces fluctuations from a practical point of view i. e., for gravimetrical prospecting. The station in Borowiec is equipped with water-tight clock- and pendula cellars, two pavillions with transit instruments and two pavillions with zenithal telescopes. At the astronomical section,

Card 24

P/002/60/000/003/001/003

D001/D101

Earth crust tidal motions...

time and latitudinal service is maintained and at the geophysics section observations of gravitation force fluctuations and plummet line deviation at right angle directions are carried out. Gravitation forces fluctuation is estimated by the Askania GS 11 No 110 recording gravimeter, sensitive to $40 \mu\text{gal}/\text{cm}$, lent by Professor T. Olczak, director of the Instytut Geofizyki i Geodezji PAN (PAS Geophysics and Geodesy Institute). The plummet line inclination is estimated by means of two horizontal pendula of the Lettau-type placed in a 10 m deep cellar. Registration, which commenced in 1958, is carried out continuously in 30 day cycles. Following the recommendations of the earth crust tidal motion committee (Doodson, Lecolazet Pertsev), the recorded graphs are evaluated by a harmonic analysis and sent to the International Geophysical Year Center. Results of 8 months investigations were presented at the Trieste Symposium in 1959. From compiled gravimetric investigation results, a suggestion emerges that a 2 - 3° phase shift of earth crust tidal motion takes place. The scientist Paryiskyi expressed the opinion that the

Card 3/4

Earth crust tidal motions...

P/002/60/000/003/001/003
D001/D101

earth's rotation retardation of 0.001 sec/100 years is to some extent influenced by the earth crust tidal motion.

TITLE: The Polish Astronomical Research Office.

PERIODICAL: Nauka Polska, no. 1 (43), 1963, 45-56.

TEXT: Until its hoped-for COA Centralne Obserwatorium Astronomiczne, Central Astronomical Observatory becomes a reality, PAN Polska Akademia Nauk, Polish Academy of Sciences has created, in 1957 Zaklad Astronomii (Astronomical Research Office) (Prof. Jozef WITKOWSKI, Director). The office comprises the existing Astrophysics Laboratory I in Torun, Astrophysics Laboratory II in Warsaw, as well as the Laboratory of Astrometry and Celestial Mechanics with its ASS Astronomiczna Stacja Szerokości, Astronomical Latitudinal Station in Borowiec (referred to as the ASS throughout the article). Its tasks are to pursue the realization of the COA and to direct the research of its institutions in the area of astrophysics, in the investigation of the physical state and chemical composition of the stars and interstellar matter in our and other galaxies, from the standpoint of evolution; and in the area of astrometry and celestial mechanics, in investigating the earth's rotational motion, cataloguing the faint stars, mechanics of the solar system, and other investigations requiring special care.

Card 1 of 3

P/002/63/000/001/001/001

The Polish Astronomical

From 1957 to 1961 the office managed to acquire from Zeiss Schmidt 60/90 cm projection telescope (placed at the Observatory in Piwnice until COA is ready); a zenith telescope, two Lettau pendulums, and three quartz clocks (for ASS); a 2-m diameter mobile parabolic telescope, 127-Mcs and 32-Mcs interferometers and a logarithmic-periodic interferometer, all of own special design (for Lab. I); and a 35-cm reflector and photoelectric photometer (for Lab. II).

In the Astrophysics Laboratory I (director: Prof. W. Iwanowska) research is being carried out in spectroscopy and stellar and radio astronomy on stellar populations, stars' magnetic fields, physics of comets, and radiowave radiation of the sun, as well as organized fundamental photometric determinations (Krakow).

The Astrophysics Laboratory II (director: Prof. W. Zonn) has been concentrating primarily on complex studies of interstellar medium (polarization, absorption, magnetic fields in interstellar space), with emphasis on the observed and theoretical problem of interstellar polarization of the stars' light. Other studies here cover gases in interstellar space, measurements of brightness of some stars, and, together with the Zaklad Geofizyki (Geophysics Research Office) of PAN, studies on the diffusion of light (sun) through diffusing media (clouds).

P/002/63/000/u01/u01/u01

The [Polish] Astronomical

The Laboratory of Astrometry and Celestial Mechanics with its ASS (director: Prof. J. Witkowski) carries out investigations on the location of the earth's rotational axis; on the motion, period, and variability of the earth's spin; and on the problem of the earth's crust flows under the gravitational effect of the sun and the moon. Vertical component measurements commenced in 1958 are submitted to the Moscow and International Data Centers.

The Astronomy Research Office is responsible for the arrangement of cooperative national projects and the extensive participation of Polish astronomy on the international level, as well as for the many publications of its workers.

ORIG. PUB. : Wydawn. własne. Inst. uprawy nawozenia i gleboznawstwa, 1957, No. 61, 29-41

ABSTRACT : At the Institute of Fertilizers and Agriculture in 1943-1944 and then in 1952-1955 at experimental fields in Celestin and Pawlowic in Poland, the possibility of using one single winter rape planting for roughage and seeds was studied. It was established that cutting the green mass of the rape produces considerable weakening of plant viability principally through the incidence of disease. The seed output was cut by 24-39%, the absolute weight:

Smigłowce (Helicopters) Warsaw, Wyd-wa komunikacyjne, 1958. 320 p. 3,140 copies printed.

Ed.: Michał Gosczyński; Tech. Ed.: Alfred Malicki.

PURPOSE: This book is intended for the general reader interested in developments in aviation.

COVERAGE: This book describes the status of helicopter development up to 1957. Design, production, and uses of helicopters as well as their special flight characteristics are discussed. Special attention is given to the description of Polish helicopters. Names of those who have contributed to the development of Polish helicopters are mentioned. Future prospects in the industry are touched upon. The book contains the technical specifications and photos of 44 of the world's outstanding helicopters. No references are given.

AUTHOR: Witkowski, Ryszard, Engineer

TITLE: A general method of determining the basic performance of a helicopter

SOURCE: Warsaw. Instytut Lotnictwa. Prace, no. 17, 1962,
8-21

TEXT: The most important parameters of the performance of a helicopter are: a) the ceiling, b) the hovering ceiling, c) the hovering ceiling with ground effect, d) vertical rate of climbing, e) vertical rate of climbing with forward speed. The author presents his semi-empirical method for determining the above parameters. Theoretical and empirical formulas used in the investigation of the ground-effect lead to an expression for the ratio of lifts (with and without ground-effect) in terms of dimensionless ceilings and forward velocities, and the final formula includes some constructional parameters, such as angular velocity of the rotor. The curves obtained from this formula can serve as a basis for plotting the data

Card 1/2

D237/D308

A general method ...

during flight, and of two methods used for obtaining these data, i.e. method of constant weight and method of constant power, the latter is used. The procedure for obtaining initial parametric relationships is illustrated and is followed by the derivation of formulas for b), d) and e). Numerical examples are given. Finally, the author discusses the influence of the ambient temperature on the performance of a helicopter and considers tropical conditions in a numerical example. All relationships are derived for the standard atmospheric sea-level conditions, i.e. $h_0 = 0$, $P_0 = 760$ mm Hg, $T_0 = 288^{\circ}\text{K}$. There are 16 figures and 10 tables.

Witkowski S. Some Possibilities of Improving Aircraft Piston Engines
"Niekłone możliwości ulepszeń lotniczych silników tłokowych"
Technika Lotnicza, No. 4, 1950, pp. 138-149, 8 figs.

Discussion of special problems concerning aircraft piston engines (temperature distribution, vibration of the cylinder head, superfluity of valves and valve actuating mechanisms from the thermodynamic point of view etc.). Discussion of problems the solution of which, in the opinion of the author, shows possibilities of a 100% performance increase in the piston engines reviewed. Discussion of fuel and water injection and ignition. The author's suggestions are: a) reduction of the dimensions of the cylinder head (reduction of the aerodynamic resistance by the introduction of Mertex (1943) valveless mechanism; b) increase of the relative speed of radial piston engines, which may be achieved by a partial load reduction of the main bearings; c) special air cooling of the piston from the inside of the crankcase; d) introduction of injection of a special ignition liquid into the combustion chamber to replace partially electric ignition

2426. PROBLEM OF HIGHER SILANES AS AIRCRAFT FUELS. Witkowski, B.
(Tekn. Lett., 1953, vol. 8, (2), 36-40; abstr. In Index aero., Nov. 1954, vol.
10, 128, 129). The author considers the main properties of silicon hydrides
of $\text{Si}_n\text{H}_{2n+2}$ type (the so-called silanes) with a view to their use as fuels
for aircraft engines, especially turbines. Attention is paid to the
calculation of the heat of combustion of silanes, for which, with the
exception of monosilane, experimental data are lacking.

AUTHOR:

Witkowski, T.

TITLE:

Production of aluminum n-propylate for organic syntheses, especially
for synthesis of aluminum salts of amino acidsPERIODICAL: Referativnyy zhurnal, Khimiya, no. 5, 1963, 422, abstract 5N63 II
(Spodziewnia Pracy Farmaceutyczno Chemiczna "Ziololek", Polish
patent 45729, 9.03.62)

TEXT: Ten g of metallic aluminum and some solution of $(C_3H_7O)_3Al$ (reaction catalyst) are added to 100 g of anhydrous C_3H_7CH and the mixture is heated to boiling. After beginning of an intense separation of H_2 the heating is discontinued. In the case of an extremely violent reaction the flask is cooled with water. After dissolution of all the Al, the excess C_3H_7 is distilled off. Eighty g of 99% C_2H_5OH is added to the residue and the mixture boiled for 15 minutes. The mixture, together with the residue of $Al(OH)_3$, is poured into a vessel for decanting, covered and left to stand for 48 hours. One hundred forty g of the clear colorless liquid, containing 0.065 g of Al in 1 g of solution is poured off. One hundred g of this liquid is added drop by drop into an agitated

solution of 18 g of $\text{H}_2\text{NCH}_2\text{COOH}$ in 35 ml of water (precipitation occurs). The mass is agitated for another 30 minutes, with gradual heating. After 24 hours, the residue is filtered out and rinsed with water. ~30 g (93.7%) $\text{H}_2\text{NCH}_2\text{COOAl(OH)}_2$ will be obtained. Z. Rachinskiy.

Wojciech P., Witkowski T. A Tentative Characterization of Polish Wines.

"Polska charakterystyka win polskich", Przemysł Rolny i Spożywczy, No. 13, 1953, pp. 419-422, 14 tabs.

An attempt was made, on the basis of 100 analyses, to delineate the characteristics of Polish fruit wines. The following ranges of sweetness of both white and red wines were examined: — dry, semi-dry, semi-sweet and sweet; and the following conclusions were arrived at:
— 1) the Polish wine industry is completely effective in protecting wines from turning to vinegar; 2) the alcohol content of wines achieves a considerable degree of uniformity and is always in excess of the minimum established by law; 3) the sugar content, especially in dry, semi-dry and semi-sweet wines, generally exceeds the minimum regulation content; 4) the extract (not counting sugar) is regularly considerably in excess of the legal requirement; 5) the total acidity of red wine generally remains within the prescribed limits; in white wine, however, it does not always conform; 6) Polish wines are immature and insufficiently aged but possess, nevertheless, a satisfactory, steadily improving blendings of flavours.
